

A cleaner Youtube

Posted by kidushashem - 27 Sep 2011 00:10

For those out there who feel they must watch youtube videos sometimes, there's an excellent extension if you use chrome or safari as your browser.

It basically turns youtube into a clean page, with just the video you're watching. No video on the side, not comments, nothing. Just the video you're meant to be watching.

Here's the link for chrome:

<chrome.google.com/webstore/detail/gmpangiimbdkhbhbhbbhkplffgkiomkh>

And for safari:

<clea.nr/>

If someone understands that this might be good for them but are not technologically oriented, please feel free to pm me or respond right here on this thread...

I'm looking for some plugin or filter that can blur pics with high skin tone, or based on gender. I have k9 but that does not resolve images on ordinary websites..

If you think I'm off the wall, check face.com.. The technology exists. Google had an API for images but is discontinuing it.

Note: I'm familiar with the browser option of removing all images, but that often makes looking up a simple thing tedious or near impossible. I'm also not the only user of pc, and cannot do this to the others.

Sounds like something that could be really useful but I haven't seen or heard of anything yet, although I'm sure you could pay for something like that, it probably wouldn't be a freebie.

I'm sorry but I didn't understand this paragraph. When you say you're familiar with the browser option of removing all images, are you referring specifically to Hidelmages or to the general concept? Which brings me to the next part which is even less clear: what do you mean it makes looking up a simple thing tedious or near impossible? I have no problems whatsoever with Hidelmages. It's an excellent extension with a button that sits in the toolbar. It doesn't hide images unless I click the button and if I decide I want to see the images after I already clicked the button, I just refresh the page. So unless you're someone who needs to find images of specific people for some reason, I can't see where this extension would cause you any problems.

Finally, your last sentence "I'm also not the only user of pc, and cannot do this to the others." is completely beyond me. I'm sorry I'm not understanding, if you could clarify I'd be glad to respond.

In the meantime, I'll see if I can find anything that removes only the pics of a specific gender or quality.

Take care,

KH

Sorry I was unclear.

I was referring to the hide images browser option. Many sites increasingly use images for buttons, menus, navigation, etc. So hiding images can become rather tedious when I need to do even something simple. I was unaware of the Plug-in you referenced.

What is the name of the plug-in, I want to install it.

Regarding the 'Other People' statement, I meant was that other people use the PC, and I cannot turn off all images on them, I prefer an alternate solution, like the plug-in you mentioned.

Thanks for the gesture.

gotcha, thanks for clarifying. I relate to your issue of not seeing the buttons for menus, navigation etc. It's not such a big issue though because I'm usually on the same websites all the time so I know where those buttons are even without seeing them. And even when I'm on an unfamiliar website, I still get to see the page for a couple seconds before I hide the images so I know more or less the layout.

I was referring to the HideImages extension the whole time. You can find it here:
www.hideimages.net/

Let me know what you think...
